

Keep taking the tablets

The history of aspirin is a product of a rollercoaster ride through time, of accidental discoveries, intuitive reasoning and intense corporate rivalry.

In the opening pages of *Aspirin: The Remarkable Story of a Wonder Drug*, Diarmuid Jeffreys describes this little white pill as ‘one of the most amazing creations in medical history, a drug so astonishingly versatile that it can relieve headache, ease your aching limbs, lower your temperature and treat some of the deadliest human diseases’.

Its properties have been known for thousands of years. Ancient Egyptian physicians used extracts from the willow tree as an analgesic, or pain killer. Centuries later the Greek physician Hippocrates recommended the bark of the willow tree as a remedy for the pains of childbirth and as a fever reducer. But it wasn't until the eighteenth and nineteenth centuries that salicylates the chemical found in the willow tree became the subject of serious scientific investigation. The race was on to identify the active ingredient and to replicate it synthetically. At the end of the nineteenth century a German company, Friedrich Bayer & Co. succeeded in creating a relatively safe and very effective chemical compound, acetylsalicylic acid, which was renamed aspirin.

The late nineteenth century was a fertile period for experimentation, partly because of the hunger among scientists to answer some of the great scientific questions, but also because those questions were within their means to answer. One scientist in a laboratory with some chemicals and a test tube could make significant breakthroughs whereas today, in order to map the human genome for

instance, one needs 'an army of researchers, a bank of computers and millions and millions of dollars'.

But an understanding of the nature of science and scientific inquiry is not enough on its own to explain how society innovates. In the nineteenth century, scientific advance was closely linked to the industrial revolution. This was a period when people frequently had the means, motive and determination to take an idea and turn it into reality. In the case of aspirin that happened piecemeal - a series of minor, often unrelated advances, fertilised by the century's broader economic, medical and scientific developments, that led to one big final breakthrough.

The link between big money and pharmaceutical innovation is also a significant one. Aspirin's continued shelf life was ensured because, for the first 70 years of its life, huge amounts of money were put into promoting it as an ordinary everyday analgesic. In the 1970s other analgesics, such as ibuprofen and paracetamol, were entering the market, and the pharmaceutical companies then focused on publicising these new drugs. But just at the same time, discoveries were made regarding the beneficial role of aspirin in preventing heart attacks, strokes and other afflictions. Had it not been for these findings, this pharmaceutical marvel may well have disappeared.

So the relationship between big money and drugs is an odd one. Commercial markets are necessary for developing new products and ensuring that they remain around long enough for scientists to carry out research on them. But the commercial markets are just as likely to kill off certain products when something

more attractive comes along. In the case of aspirin, a potential 'wonder drug' was around for over 70 years without anybody investigating the way in which it achieved its effects, because they were making more than enough money out of it as it was. If ibuprofen or paracetamol had entered the market just a decade earlier, aspirin might then not be here today. It would be just another forgotten drug that people hadn't bothered to explore.

None of the recent discoveries of aspirin's benefits was made by the big pharmaceutical companies; they were made by scientists working in the public sector. 'The reason for that is very simple and straightforward,' Jeffreys says in his book. 'Drug companies will only pursue research that is going to deliver financial benefits. There's no profit in aspirin anymore. It is incredibly inexpensive with tiny profit margins and it has no patent anymore, so anyone can produce it.' In fact, there's almost a disincentive for drug companies to further boost the drug, he argues, as it could possibly put them out of business by stopping them from selling their more expensive brands.

So what is the solution to a lack of commercial interest in further exploring the therapeutic benefits of aspirin? More public money going into clinical trials, says Jeffreys. 'If I were the Department of Health. I would say "this is a very inexpensive drug. There may be a lot of other things we could do with it." We should put a lot more money into trying to find out.'

Jeffreys' book which not only tells the tale of a 'wonder drug' but also explores the nature of innovation and the role of big business, public money and regulation reminds us why such research is so important.

Questions 27-32

Complete each sentence with the correct ending A-H from the box below.

Write the correct letter A-H in boxes 27-32 on your answer sheet.

27. Ancient Egyptian and Greek doctors were aware of

28. Frederick Bayer & Co were able to reproduce

29. The development of aspirin was partly due to the effects of

30. The creation of a market for aspirin as a painkiller was achieved through

31. Aspirin might have become unavailable without

32. The way in which aspirin actually worked was not investigated by

A. the discovery of new medical applications.

B. the negative effects of publicity.

C. the large pharmaceutical companies.

D. the industrial revolution.

E. the medical uses of a particular tree

F. the limited availability of new drugs.

G. the chemical found in the willow tree.

H. commercial advertising campaigns.

Questions 33-37

Do the following statements agree with the views of the writer in Reading Passage 287?

In boxes 33-37 on your answer sheet write -

YES

if the statement agrees with the views of the writer

NO if the statement contradicts the views of the writer

NOT GIVEN if it is impossible to say what the writer thinks about this

33. For nineteenth-century scientists, small-scale research was enough to make important discoveries.

34. The nineteenth-century industrial revolution caused a change in the focus of scientific research.

35. The development of aspirin in the nineteenth century followed a structured pattern of development.

36. In the 1970s sales of new analgesic drugs overtook sales of aspirin.

37. Commercial companies may have both good and bad effects on the availability of pharmaceutical products.

Questions 38-40

Complete the summary below using the list of words A-I below.

Write the correct letter A-I in boxes 38-40 on your answer sheet

Research into aspirin

Jeffreys argues that the reason why 38..... did not find out about new uses of aspirin is that aspirin is no longer a 39..... drug. He, therefore, suggests that there should be 40..... support for further research into the possible applications of the drug.

A useful

B cheap

C state

D international

E major drug companies

F profitable

G commercial

H public sector scientists

I health officials

ANSWER
27. E
28. G
29. D
30. H
31. A
32. C
33. YES
34. NOT GIVEN
35. NO
36. NOT GIVEN
37. YES
38. E
39. F
40. C
